

Creating a Batch File to Set Path in Java

Whenever there is a need to copy a path, we just use our basic skills of copying and pasting them. But here are some of the wonderful tricks we can actually use them to minimize our time wastage.

Here I am taking an example of setting a PATH for JAVA

- First of all Open NOTEPAD

Type in

set path=

- then copy the path of the folder we want

- here it is the bin folder in jdk1.6 in java in programfiles(x86)

set path=C:\Program Files (x86)\Java\jdk1.6.0_06\bin

- After that give it a break as usual using a semicolon(;

set path=C:\Program Files (x86)\Java\jdk1.6.0_06\bin;

Save the File using a desired name

The extension of the file is .bat [(batch)]

Here it is,

java.bat

Save it.

Now open Command Prompt

Type in java.bat in the desired drive

The path will be automatically set.

Hope you all find it useful.

More tricks coming soon :-)
